Team name: FRAZER

Team members:

- Rashad Gasimov
- Nihad Guliyev
- Kristen Couty
- Laurick Spahn-Eigner

Problem statement (one sentence)

University classes often rely on generic messaging applications that lack structure, role management, and academic-specific tools, making communication and organization inefficient.

Target user (who is it for?)

The application is designed for university students, class delegates, and professors who need a structured and reliable platform to communicate, share official information, organize academic activities, and manage class-related interactions.

MVP features (A minimum viable product)

- User authentication and role-based access (student, delegate, professor)
- Creation and management of class groups
- Group messaging for each class
- Official announcements posted by professors and delegates
- Access to the class timetable
- Organization of study events (e.g. revision sessions)
- Delegate election system with an integrated voting mechanism

Multimedia requirement

The project will include a live web-based demonstration showing user authentication, class group interaction, announcements, and the delegate voting process. A short presentation and application walkthrough will be used during the final project defense.

Risks

- Managing role-based permissions correctly
- Ensuring secure authentication and voting integrity
- Time constraints due to the scope of features
- Team coordination and integration between frontend and backend components
